Stake your FTP and get up to 50% extra tokens

While many crypto investors set up expensive mining farms in order to receive free tokens, there is another option available that requires no investment into hardware infrastructure: Crypto Staking.

Crypto staking involves "locking up" a portion of your tokens for a period of time on the blockchain against your nominated wallet. In exchange, stakers can earn rewards, typically in the form of additional coins or tokens, which will be received at the end of the expiry period..

What is crypto staking?

Crypto staking is similar to depositing money in a bank where an person locks their money and receives an "interest" payment in exchange for locking the funds as a reward.

Staking is a term used to refer to the temporary locking of selected number of tokens similar to the bank locking the funds in the bank.

The Staked tokens are locked by a smart contract on the blockchain for a specified length of time. The tokens are locked against the nominated wallet number and are received at the end of the locking period.

Whilst the Stake user benefits by receiving the extra tokens as a reward, the community also benefits from the Staking because the tokens are taken out of circulation against sale.
